

Use case:
Patient is brought in by ambulance after fainting due to low blood-sugar, gets admitted to the ER after triage, gets glucose administered and discharged.

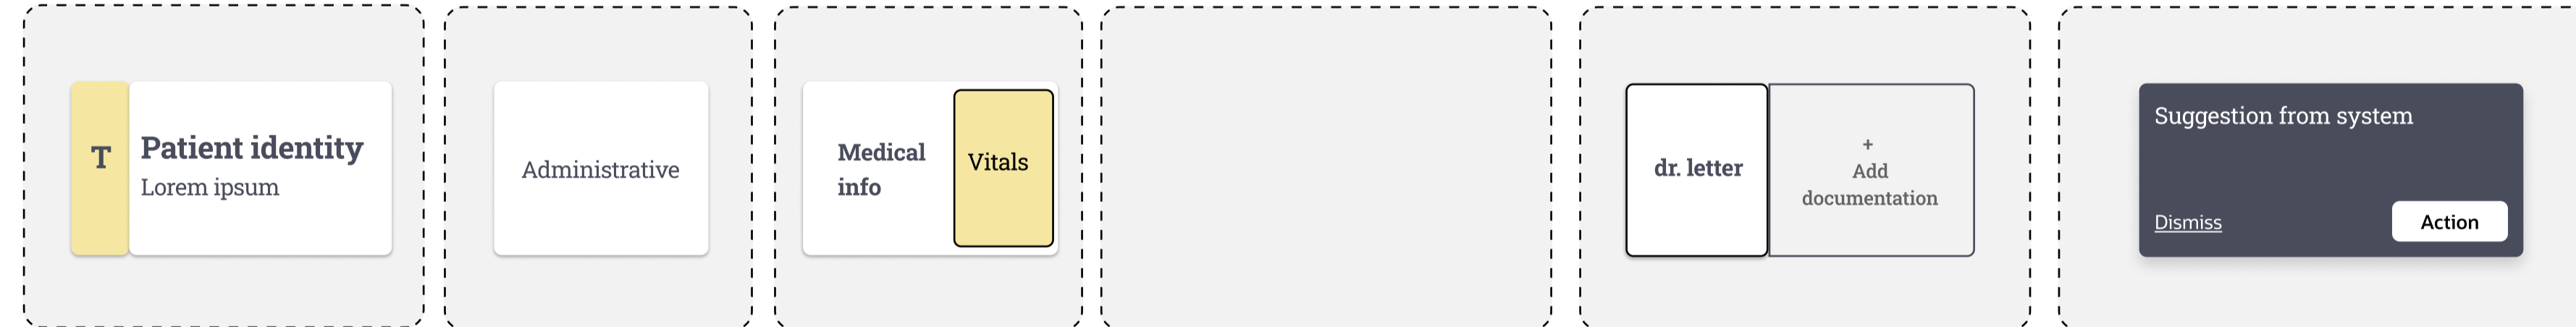

Ambulance documents patient info and announces them to the ER

Triage nurse determines triage level and medical indicators, and assigns Patient to relevant department and doctor.

Doctor consults Patient and formulates care plan based on their diagnostic, EHR and vital signs.

Doctor and nurses can order blood work, medication and other procedures, based on suggestions or templates.

When treatment plan is complete and Patient is stable, they are discharged and documentation is finalised for dr's letter, insurance.
